PRECISION PANEL LINER

What do we use them for?

Panel liners are used to highlight volumes and define the different fuselage plates, panels, and details on airplanes, tanks, trains, cars, ships, robots, etc.

All models have in common that they feature structures and details outlined by lines, either raised or recessed. We must consider the detailing of these structures in the model to achieve greater realism and visual richness.

Panel liners are used after the model has been painted to add depth and volume to details and structural shapes.

Features

Precision panel liners are formulated with a blend of enamel-based products that allow the paint to flow efficiently by capillary action without spreading or staining large areas.

The enamel base is ideal for panel lining as it prevents the surface tension typical of acrylic products, allowing the paint to flow easily through the details.

Precision panel liners feature a highly pointed brush with fewer fibers. These fibers are longer than those of a standard brush, enabling a greater paint load, which is essential for the panel lining process and for highlighting structural lines in a single pass. The precision of the brush allows the paint to flow around details and into recesses without spilling, ensuring controlled application.

New Applicator, Greater Precision

Colors

LIGHT GREY	AK12101	
BLACK	AK12102	
SEPIA	AK12103	
DARK BROWN	AK12104	
FRESH RUST	AK12105	
DARK RUST	AK12106	
RAW UMBER GREENISH	AK12107	

How to Use

1 Choosing the Color

An important aspect when selecting a panel liner is choosing the right color, which should contrast with the base tone to ensure visibility.

Typically, darker colors are used than the base color. However, for a black base, a much lighter color such as gray can be used.

2 Application

Apply the panel liner using the precision brush on the surface you want to highlight, aiming to be as clean and precise as possible.

3 Final Touch-Up

After a few minutes, you can remove the excess with a clean brush (or, if necessary, a paper) dampened with White Spirit.

THIS TECHNIQUE IS VERY SIMPLE
AND DELIVERS EXCELLENT RESULTS.
